

PROJECT REQUIREMENTS DOCUMENT

Momo - The Cat: Hybrid Platform

Domain: momothecat.shop

Architecture Model: Phase 1 (Affiliate) to Phase 2 (In-House Retail)

Design Reference: [Pettie Theme Demo](#) (Vibrant, Grid-based, AJAX-enabled)

1. Executive Summary

This document outlines the technical requirements, database architecture, and design system for a scalable, Next.js-based e-commerce platform for **Momo - The Cat**. The business model utilizes a phased approach: operating as an affiliate marketing hub in Phase 1 to build SEO and traffic on momothecat.shop, before transitioning to a full-fledged independent retail storefront in Phase 2.

Phase 1: Traffic & Affiliate Revenue

The platform will display products using high-converting UI components. However, all product clicks will route users to Amazon via affiliate links. The backend will secretly begin collecting customer leads via newsletter popups.

Phase 2: In-House Retail Flip

The transition requires zero code overhaul. The admin will upload new "Real Products" to the system, activate the dormant shopping cart, integrate Stripe, and seamlessly drop the affiliate database collection.

2. Technical Stack

- **Frontend Framework:** Next.js (App Router) for Server-Side Rendering (SSR) and optimal SEO performance.
- **Styling & UI Components:** Tailwind CSS paired with accessible component libraries (e.g., Shadcn UI) to match the modern "Pettie" design aesthetic.
- **Database:** MongoDB via Mongoose. Utilizing a strict Dual-Schema model to separate affiliate links from real inventory.
- **Authentication:** NextAuth.js for secure Admin Dashboard access.
- **Media Storage:** Cloudinary or AWS S3 for hosting high-resolution product imagery (Critical for e-commerce conversion).
- **Payment Gateway (Dormant):** Stripe integration built into the codebase but conditionally hidden from the UI during Phase 1.

3. Database Architecture (Dual-Schema)

To ensure a clean transition in Phase 2, the application will use two separate MongoDB collections for products. A Next.js server component will fetch and merge these collections for frontend display.

Schema A: Affiliate Products Phase 1

Field Name	Data Type	Requirement	Description
name	String	Required	Product title optimized for display.
price	Number	Required	Current estimated price on partner site.
category	String	Required	Used for Mega Menu and grid filtering (e.g., Toys, Food).
imageUrl	String	Required	Single high-res image URL (Cloudinary).
affiliateLink	String	Required	Direct outbound URL to Amazon with affiliate tag.

Schema B: Real Products Phase 2

Field Name	Data Type	Requirement	Description
name & price	String / Num	Required	Standard e-commerce fields.
images	Array [String]	Required	Multiple angles for product gallery slider.
stockQuantity	Number	Required (Def: 0)	Inventory tracker. Disables "Add to Cart" if 0.
sku	String	Unique	Internal tracking ID for warehouse fulfillment.
weightInOunces	Number	Optional	Calculates shipping rates at checkout.

4. UI/UX Design System

Based on the requested reference design ([Pettie Theme Demo](#)), the frontend must be vibrant, welcoming, and highly structured to encourage browsing. The design language must communicate trust to pet owners and establish the **Momo - The Cat** brand identity.

Color Palette

- **Primary Accent:** Warm Coral/Orange (e.g., #f97316). Used for buttons and highlights.
- **Secondary Accent:** Soft Teal/Mint (e.g., #14b8a6). Used for badges and secondary actions.
- **Backgrounds:** Off-white (#fafafa) to allow product images to pop.

Typography

- **Headings:** A bold, rounded sans-serif (e.g., *Nunito* or *Quicksand*) to convey a friendly tone.
- **Body:** A highly readable sans-serif (e.g., *Inter* or *Roboto*) for product descriptions.

Storefront Layout Requirements

- **Header & Navigation:** Must include a "Mega Menu" for category organization (Cat Toys, Cat Food, Grooming, Accessories). A prominent search bar is required.
- **Hero Section:** A wide carousel or static banner showcasing seasonal offers or a welcoming brand message, featuring high-quality images of cats.
- **Dynamic Product Grids:** The homepage must feature distinct horizontal sections: "Best Sellers", "New Arrivals", and "Category Highlights".
 - The grid will map over the merged database arrays (Affiliate + Real).
 - **Hover States:** Product cards should subtly elevate or reveal a quick-view button on hover.
- **Lead Capture Footer:** A persistent newsletter signup block offering a "10% off your first order" incentive to build the customer database prior to Phase 2 launch.

5. Component Logic & Admin Dashboard

The Smart Product Card Component

The core UI component handling the transition is the `ProductCard`. It receives a product object and checks the injected `type` property.

- **If `Type === 'affiliate'`:** Renders a button reading "View on Amazon" configured as an external link (`target="_blank"`). The local Shopping Cart context is bypassed.
- **If `Type === 'real'`:** Renders an "Add to Cart" button. Clicking the image routes the user to the local `/product/[id]` details page.

Admin Dashboard Specifications

The protected `/admin` route serves as the central command center for the platform.

Admin Module	Functionality Requirements
Inventory Hub	Two distinct data entry forms: one for Affiliate Links (requires URL) and one for Real Products (requires stock count, SKU, gallery upload).
Order Management	UI built for Phase 2. Tracks Stripe payment status, fulfillment tracking numbers, and customer details. (Hidden or empty during Phase 1).
Lead Database	A table displaying captured emails from the storefront footer, exportable to CSV for Mailchimp integration.
Phase 2 Toggle	A master script executable from the dashboard to drop the <code>AffiliateProduct</code> collection when ready to pivot to 100% in-house retail.
